The Mismatch Study

The Mismatch Study collects data from volunteer participants with memory or thinking difficulties possibly due to Alzheimer's disease.

The data will be used to enhance our understanding of and ability to accurately diagnose Alzheimer's disease, as well as account for other brain factors that may contribute to symptoms.

For more information, contact Jacqueline Lane

jacqueline.lane@pennmedicine.upenn.edu

Who can participate?

Adults who:

- are 65 years or older
- are diagnosed with Mild Cognitive Impairment or Alzheimer's disease
- have a study partner who can answer questions about the study participant's memory and thinking

Study participation includes:

- In-person visit to complete questionnaires, memory/thinking tests, and a blood draw*
- One MRI scan
- Two PET scans (amyloid & tau)

*if co-enrolling into the ABC Study

Compensation:

You will be compensated $25 for the testing visit and $50 for each scan.
